WATER QUALITY MONITORING QUARTER 32 – JUNE 2020 DUNGOG LANDFILL SITE

1 INTRODUCTION

RCA Australia (RCA) was engaged to undertake environmental monitoring for the Dungog Shire Council Waste Facility on the 26 June 2020. The monitoring made up the third quarterly round (Q3) of monitoring required to be undertaken for the 2019 – 2020 sampling period. Sampling works for the Q3 monitoring round was undertaken as per the monitoring requirements outlined in the Dungog Shire Council Waste Facility Environmental Protection Licence EPL 5894 (EPL 5894).

2 SCOPE OF WORKS

The objective of this project was to undertake environmental monitoring at the Dungog and Martins Creek Landfill sites in accordance with the EPL 5894 requirements.

The scope of works for this project included:

- Preparation of safety and environmental documents;
- Quarterly sampling of the Dungog Leachate Dam and the Martins Creek Leachate Dam as well as the annual sampling of the Dungog groundwater monitoring well.
- Analysis of the three collected samples in accordance with the site's EPL 5894 compliance requirements; and
- Compilation of a report summarizing the results from the Q3 2020 sampling event.

3 SITE GUIDELINES AND ASSESSMENT CRITERIA

EPL 5894 requires leachate monitoring to be conducted on a quarterly basis and groundwater sampling on an annual basis in order to assess the water quality present at the site. The analysis suite, as specified in EPL 5894, are for monitoring purposes only and no guideline criteria is specified.

For comparative purposes, this report has used additional water quality guidelines as assessment indicators. Guidelines used include the Australian Water Quality Guidelines for Fresh and Marine Waters (ANZECC, 2000) and the Australian Drinking Water Guidelines, hereafter referred to as ADWG, (NHRMC, 2011 updated 2018). It should be noted that assessment criteria used in this report, provided in **Table 1**, have not been altered from those presented by the previous sampling contractor for continuity of historical data.

 Table 1
 Assessment Criteria

Parameter	Units	PQL	Australian Drinking Water Quality Guidelines (ADWG) (mg/L) ^a	ANZECC 95% Trigger Values for Fresh Water (mg/L) ^b	
Hydroxide Alkalinity as CaCO ₃	mg/L	1	-	-	
Carbonate Alkalinity as CaCO ₃	mg/L	1	-	-	
Bicarbonate Alkalinity as CaCO ₃	mg/L	1	-	-	
Total Alkalinity as CaCO ₃	mg/L	1	-	-	
Ammonia as N	mg/L	0.01	0.5°	0.9 ^f	
Calcium	mg/L	1	-	-	
Chloride	mg/L	1	250°	-	
Thermotolerant Faecal Coliforms	cfu/100mL	-	0	1000 ^g	
Electrical Conductivity	μS/cm	1	125 - 2200	30 - 350 ^d	
Magnesium	mg/L	1	-	-	
Nitrate as N	mg/L	0.01	50	0.7	
Potassium	mg/L	1	-	-	
рН	pH units	-	6.5 - 8.5	6.5 - 8	
Sodium	mg/L	1	180°	-	
Sulfate	mg/L	1	250°	-	
Total Dissolved Solids	mg/L	5	600°	-	
Total Organic Carbon	mg/L	1	-	-	
Total Suspended Solids	mg/L	5	-	-	

[&]quot;-" indicates no criterion available

PQL = Practical Quantitation Limit.

- d Default trigger values for slightly disturbed upland river ecosystems in South-East Australia.
- e Based on a value which may result in lime scaling. Alkalinity is an indicator for landfill leachate.
- f Trigger value for pH 8.0, other values are listed in ANZECC section 8.3.7.2.
- g Trigger value for secondary human contact, see ANZECC Section 5.2.3.

4 FIELDWORK

An environmental technician trained and experienced in water sampling undertook the fieldwork on the 26 June 2020. Sampling was conducted in accordance with Australian Standard AS5667.1998 Water Quality Sampling. The scope of work included:

- Collection of one water samples from the Dungog Leachate Dam.
- Analysis of one water sample for the analytes stipulated in EPL 5894.

a From Australian Drinking Water Guidelines Version 3.5 (NHRMC/ NRMMC, update 2018).

b Primarily from ANZECC (2000) Australian and New Zealand Guidelines for Fresh and Marine Water Quality
- Chapter 3 Aquatic Ecosystems (Trigger levels for fresh water slightly - moderately
disturbed system)c Guideline based on Aesthetic Criteria.

All samples were preserved as recommended by the analytical laboratory and stored in a chilled esky for preservation purposes. Samples were sent to the laboratory within 24 hours of sampling. All samples were sent under Chain of Custody (COC) documentation detailing the sample identification, required analysis, the name of the sampler and date released from custody. The laboratories acknowledged the receipt of samples by signature and date and returned the COC with a sample receipt notice indicating the condition of the samples received upon receipt.

The sampling field sheet is attached in **Appendix B**.

5 QUALITY CONTROL

The collection of the water sample was undertaken in compliance with RCA methodology. Surface water sample collection methods comprised of direct sampling into the bottle from surface water body.

These surface water collection methods were chosen for the site as recommended by the Australian Standard 5667.1:1998 Water Quality Sampling.

The analytical procedures used by RCA Laboratories are based on established internationally recognised procedures such as APHA and Australian Standards. RCA Laboratories - Environmental conduct the NATA accredited analysis of the pH, EC, TDS, TSS and faecal coliforms.

When an external testing laboratory is used to obtain the analysis of samples that become a part of this report, then the details of that laboratory's NATA accreditation and their official report will be attached as an appendix.

Quality assurance and control analysis was undertaken as part of the project scope of works. Quality results from the internal RCA Laboratories - Environmental are included within the laboratory report provided in **Appendix C**, whilst external laboratory quality control documents are presented in **Appendix E**

6 RESULTS

The water quality assessment criteria presented are for comparison purposes only. The Site's EPL requirements do not specify any monitoring criteria to assess the concentration ranges of analytes. Water quality results compared against limit concentrations are presented in **Table 2**.

 Table 2
 Water Quality Results versus Assessment Criteria

Parameter	Units	Leachate Storage Pond	Australian Drinking	ANZECC	
Sample Number		062010408001	Water	95% Trigger Values for	
Sample Date		26/06/2020	Quality Guidelines	Fresh Water	
Sample Time		8:15	(mg/L) ^a	(mg/L) ^b	
Field Technician		SK			
Hydroxide Alkalinity as CaCO₃	mg/L	<1	-	-	
Carbonate Alkalinity as CaCO ₃	mg/L	<1	-	-	
Bicarbonate Alkalinity as CaCO ₃	mg/L	654	-	-	
Total Alkalinity as CaCO ₃	mg/L	654	200e	-	
Ammonia as N	mg/L	0.06	0.5°	0.9 ^f	
Calcium	mg/L	122	-	-	
Chloride	mg/L	377	250°	-	
Coliforms	cfu/100mL	~70	-	1000 ^g	
Electrical Conductivity	μS/cm	2080	125 - 2200	30 - 350 ^d	
Magnesium	mg/L	64	-	-	
Nitrate as N	mg/L	<0.01	50	0.7	
Potassium	mg/L	26	-	-	
pH (pH units)	pH units	7.19	6.5 - 8.5	6.5 - 8.0	
Sodium	mg/L	240	180°	-	
Sulfate	mg/L	108	500, 250°	-	
Total Dissolved Solids	mg/L	1257	600°	-	
Total Organic Carbon	mg/L	26	-	-	
Total Suspended Solids	mg/L	14	-	-	

Notes:

Result in italics indicates that the concentration is exceeding one of the assessment guidelines. Refer to the summary for further details.

PQL = Practical Quantitation Limit.

- a From Australian Drinking Water Guidelines Version 3.5 (NHRMC/NRMMC,update 2018).
- b Primarily from ANZECC (2000) Australian and New Zealand Guidelines for Fresh and Marine Water Quality Chapter 3 Aquatic Ecosystems (Trigger levels for fresh water slightly moderately disturbed system).
- c Guideline based on Aesthetic Criteria.
- d Default trigger values for slightly disturbed upland river ecosystems in South-East Australia.
- e Based on a value which may result in lime scaling. Alkalinity is an indicator for landfill leachate.
- f Trigger value for pH 8.0, other values are listed in ANZECC section 8.3.7.2.
- g Trigger value for secondary human contact, see ANZECC Section 5.2.3.

[&]quot;-" indicates no criterion available.

Analytical laboratory NATA reports and quality assurance documentation are presented in **Appendices C**, **D** and **E**.

During the Q3 monitoring round, there were five results in excess of the assessment criteria as summarized below:

- Electrical conductivity was above the upper criterion indicated in the ANZECC 95% protection level for fresh water for the Dungog leachate Dam sample. Leachate sample was above the upper criterion outlined in the ADWG.
- Total dissolved solids concentration leachate dam sample were in excess of the ADWG aesthetic criterion. This aesthetic guideline is based upon the taste factor.
- The concentration of chloride was in excess of the ADWG in the Dungog Leachate Dam sample.
- The sodium concentration was greater than the ADWG aesthetic criterion in the Dungog Leachate Dam sample. No health effects have been associated with TDS concentrations, and the aesthetic guideline is based upon the taste factor.
- Thermotolerant coliforms were below the limits indicated in the ANZECC 95% protection level for fresh water.
- Ammonia was below the upper criterion indicated in the ANZECC 95% protection level for fresh water and ADWG for the Dungog leachate Dam sample.
- Total Alkalinity as CaCO₃ was above the upper criterion indicated in the ADWG for the Dungog leachate Dam sample.

7 LIMITATIONS

This report has been prepared for Dungog Shire Council in accordance with an agreement with RCA dated 2 December 2013. The services performed by RCA have been conducted in a manner consistent with that generally exercised by members of its profession and consulting practice.

This report has been prepared for the use of Dungog Shire Council. The report for September does not contain sufficient information for purposes of other users or for parties other than Dungog Shire Council. This report shall only be presented in full and may not be used to support objectives other than those stated in the report without written permission from RCA.

Environmental conditions including contaminant concentrations can change in a limited period of time. This should be considered if the report is used following a significant period of time after the date of issue.

Neena Tewari

Senior Environmental Microbiologist

The information in this report is considered accurate at the date of issue. Please contact the undersigned if you have any queries on the above.

Yours faithfully RCA AUSTRALIA

RCA Internal Quality Review

General

- Laboratory QC results for Method Blanks, Duplicates and Laboratory Control Samples are included in this QC report where applicable. Additional QC data maybe available on request.
- RCA QC Acceptance / Rejection Criteria are available on request.
- 3. Proficiency Trial results are available on request.
- 4. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
- 5. When individual results are qualified in the body of a report, refer to the qualifier descriptions that follow.
- Samples were analysed on an 'as received' basis
- Sampled dates in this report are those listed on the COC or sample jars; if no sample dates are noted, the date the samples are received at the laboratory have been used.
- 8. All soil results are reported on a dry basis, unless otherwise stated. (ACID SULPHATE SOILS)
- This report replaces any interim results previously issued.

Holding Times.

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample

Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

**NOTE: pH duplicates are reported as a range NOT as RPD

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR: RPD must lie between 0-30%

QC DATA GENERAL COMMENTS

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Glossary

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre ppm: Parts per million

ppb: Parts per billion %: Percentage

org/100ml: Organisms per 100 millilitres NTU: Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per Litre

TERMS

Dry Where moisture has been determined on a solid sample the result is expressed on a dry basis.

LOR Limit of Reporting.

RPD Relative Percent Difference between two Duplicate pieces of analysis can be obtained upon request.

QCS Quality Control Sample - reported as value recovery

Method Blank In the case of solid samples these are performed on laboratory certified clean sands.

In the case of water samples these are performed on de-ionised water. \\

Duplicate A second piece of analysis from the same sample and reported in the same units as the result to show comparison.

Batch Duplicate A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key: CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

- ^ = This result is computed from individual analyte detections at or above the level of reporting
- ø = ALS is not NATA accredited for these tests.
- ~ = Indicates an estimated value.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key: Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit: Result between 10 and 20 times LOR: 0% - 50%: Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: WATER				Method Blank (MB)		Laboratory Control Spike (LC	S) Report

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers: Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- NO Method Blank value outliers occur.
- NO Duplicate outliers occur.
- NO Laboratory Control outliers occur.
- Matrix Spike outliers exist please see following pages for full details.
- For all regular sample matrices, NO surrogate recovery outliers occur.

Outliers: Analysis Holding Time Compliance

• NO Analysis Holding Time Outliers exist.

Outliers: Frequency of Quality Control Samples

NO Quality Control Sample Frequency Outliers exist.

Page : 2 of 5

			Turbidimetric		Determined		background level greater than or
							equal to 4x spike level.

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for <u>VOC in soils</u> vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER	Evaluation: ▼ = Holding time breach ; ✓ = With	in holding time

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: WATER Evaluation: × = Quality Control frequency not within specification; ✓ = Quality Control frequency within specification. Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 CI - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3)
			Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)
Total Organic Carbon	EP005	WATER	In house: Referenced to APHA 5310 B, The automated TOC analyzer determines Total and Inorganic Carbon by IR cell. TOC is calculated as the difference. This method is compliant with NEPM (2013) Schedule B(3)
